NAPHTHOL-T

APPLICATION

Typically, colored shirts must be processed at low temperature without caustic ingredients due to the potential for color loss in the wash operation.

In this milder cleaning environment, it is common for the commercial operator to find inordinate number of wash overs due to oily stains; in some cases, these items are then sent to the dry cleaning machine for costly and time consuming re-cleaning.

PRODUCT DESCRIPTION

NAPHTHOL-T represents a “breakthrough” commercial Laundry product for effective washing of colored shirts in warm to cool water temperatures. The product is also effective on white shirts in high temperature applications (in conjunction with a separate bleach). **NAPHTOL-T** is a non-caustic, powdered, mildly built product that contains numerous ingredients for water conditioning and oily stain removal.

USAGE DIRECTIONS

For colored shirts, the product is used at a dosage range of 8-12 oz. per 50lb (90-100 shirts) load in cool to warm water (80 - 110°F). Product can also be used with separate oxygen bleach. Do not throw powders on top of shirts. For white shirts, use same dosage at 150°F with bleach adjunct.

PACKAGING

NAPHTHOL-T is packaged in 400lb. & 100lb. fiber kegs.
